Web data extraction systems refers to the task of providing a uniform access to multiple Web data sources. The ultimate goal of Web data integration is similar to the objective of data integration in database systems. However, the main difference is that Web data sources (i.e., Websites) do not feature a structured data format which can be accessed and

We explore a new task of information extraction with an ontology, which aims to extract evidence information from court record documents in the legal domain. We formalize evidence information extraction task as an integration of paragraph classification and sequence labeling problem, and propose an end-to-end joint model for the task.
