Also I have imported css3-mediaqueries.js script since IE 8 or later does not support media queries. Then I have used another conditional comment if browser is Not IE. In this statement I first check whether browsing device is a computer (media="only screen"), if so I import styles specific to computer screens that adjust for screen resolution.

Adjusting your Websites to Fit all Types of Resolution ...

To detect the screen resolution, use the concept of window.screen. For width, use the following –

Read Online Javascript Resolution

window.screen.availWidth. For height –
window.screen.availHeight

How to detect the screen resolution with JavaScript?

Document size methods are often needed in scrolling apps. Note the difference between `jQuery(document).width()` and the native properties (especially when the window is wider than the max-width of the body). jQuery uses the `Math.max` of 5 numbers to calculate this. For decent cross-browser support, the `Math.max` of the 3 `document.documentElement` properties seems to suffice.

Device and Viewport Size In JavaScript

The resolution CSS media feature can be used to test the pixel density of the output device.. Syntax. The resolution feature is specified as a `<resolution>` value representing the pixel density of the output device.
