Dispersion is a key phase in paint manufacturing. When it comes to emulsified paints, for example, it is widely considered as the most important phase. The goal in the dispersion phase is to cause most of the agglomerated

How to disperse and stabilize pigments

Pigment dispersion requirements in the lab include good color development, a homogeneous paste, sufficient opacity or transparency and excellent stability as a paste and in a paint. The lab dispersion then must be scaled up to make paste batches in the paint plant. This often is difficult. The increase in volume

Partial coverage by one pigment resulting in ugly streaks or mottled regions is called floating, although both defects sometimes are labeled as floating since, in both cases, pigment is floating to the surface. Flooding and floating both produce unacceptable color effects.
