In Patterns and Processes of Vertebrate Evolution Carroll undertook an ambitious project — nothing less than to update George Gaylord Simpson's classic works from the 1940s and 50s, Tempo and Mode in Evolution and The Major Features of Evolution. The result is a "broad picture" overview of the processes of evolutionary change, centred on paleontology but attempting to integrate that with the rest of biology.

Gerardo De Iuliis PhD, Dino Pulerà MScBMC, CMI, in The Dissection of Vertebrates (Second Edition), 2011. Vertebrae. The vertebral column (Figure 9.3) normally includes 14 cervical, 5 thoracic, 6 lumbar, 2 sacral, and 15 caudal vertebrae. The column of the pigeon, as with most birds, is notable for its degree of fusion, with the exception of the cervical vertebrae.

The vertebra prominens, or C7, has a distinctive long and prominent spinous process, which is palpable from the skin surface. Sometimes, the seventh cervical vertebra is associated with an abnormal extra rib, known as a cervical rib, which develops from the anterior root of the transverse process. These ribs are usually small, but may occasionally compress blood vessels (such as the subclavian ...

The vertebral column, also known as the backbone or spine, is part of the axial skeleton. The vertebral column is the defining characteristic of a vertebrate in which the notochord (a flexible rod of uniform composition) found in all chordates has been replaced by a segmented series of bone: vertebrae separated by intervertebral discs. The vertebral column houses the spinal canal, a cavity that ...

The costovertebral joints are synovial joints found between the ribs and the transverse processes of the vertebra of the same level for ribs 1 through 10 (see Figure 8-2). Because ribs 11 and 12 do not articulate with the transverse processes, this joint does not exist for these two levels. The costovertebral joints are supported by three ligaments.
