"Design of pumps". Each liquid possesses diverse characteristics that may influence not only the choice of the pump, but also its configuration such as the type of the mechanical seal or the motor. Fundamental characteristics in this respect are: • Viscosity (friction losses) • Corrodibility (corrosion) • Abrasion • Temperature (cavitation)

Manual for the Design of Pipe Systems and Pumps

The steps to follow to select a centrifugal pump are: 1. Determine the flow rate To size and select a centrifugal pump, first determine the flow rate. If you are a home... 2. Determine the static head This a matter of taking measurements of the height between the suction tank fluid surface... 3. ...

HOW TO design a pump system

A Step-by-Step Approach to Pump Selection 1. Before talking about a pump, consider the pipe.. Velocity of liquid in pipes ranges between 3 to 10 feet per second... 2. Now that we have the pipe, pressure is the next step.. Pressure comes from friction and elevation. We will assume no... 3. We now can ...

For more details on the construction of jet pumps see this article: specialty pumps. The system in Figure 3 is another typical domestic water supply system that takes it's water from a deep well (200-300 feet) and uses a multi-stage submersible pump often called a turbine pump.

HOW TO design a pump system

The system curve is matched with various pump curves in an iterative process to determine which pump will best match the demands of the project. Once the pump is selected, all the additional components, such. as the wet well, valve vault, valve and pipes, control system, etc., can be sized.

Pump Station Design Guidelines Second Edition

Ideally, the flow of fluid into any pump should be uniform, steady, and free from swirl and entrained air. Lack of uniformity can cause a pump to operate at a lower efficiency. Unsteady flow causes the load on the impeller to fluctuate, which can lead to noise, vibration, and bearing problems. Swirl in the pump intake can cause a significant change

Design Recommendations - Xylem Inc.

Fire pump design An outside screw and yoke gate valve must be installed in the suction pipe to provide a means of isolation from the incoming supply line (NFPA 20-2013, Section 4.14.5.1).

Consulting - Specifying Engineer | NFPA 20: Fire pump design

pump should coincide as closely as possible with the design flow and best efficiency point of the pump. Pump efficiency is also an important factor to consider in the selection process. Pump efficiencies will vary because of impeller design (vortex, semi-open, closed) and pump housing design (concentric or convolute). While all these

Design of Sewage Pumping Stations

DESIGN AND CONSTRUCTION STANDARD I. Fire Pump, Motor, and Controller: 1. The main fire pump controller shall be a factory assembled, wired, and tested unit. 2. The controller shall be of the combined manual and automatic type designed for across-the-line type starting.

SECTION 5.21.30 - FIRE PUMPS DESIGN AND CONSTRUCTION STANDARD

More Points to be Taken Care while Designing Pump Suction Piping Feed pipe must be fully submerged in the tank or vessel. If it's too close to the surface of the fluid, the suction... Feed pipe must not be too close to the bottom of the tank or vessel. If it's too close to the bottom of fluid, ...

Pumps Suction Piping - Eccentric Reducers & Straight ...

A pump circulates water or a water and antifreeze solution through the heat pump water-to-refrigerant heat exchanger and the submerged piping loop which transfers heat to or from the body of water. Open-loop surface water heat pumps can use surface water bodies in a similar way that cooling towers are used, but without the fan energy and required maintenance.

Geothermal Heat Pumps | WBDG - Whole Building Design Guide

For horizontal-inlet pumps, the reducer at the pump should be eccentric, with the straight side up. This avoids the creation of a high point in the piping where gas can collect. For top-inlet pumps, the reducer may be concentric or eccentric, as required to obtain clearance with the discharge piping. Suction Gauge

Suction-Side System Design; If You Do ... - Pumps & Systems

- Horizontal elbows or tees upstream of a fire pump must be 10 pipe diameters from the suction flange on a split-case fire pump.
- Pumps must maintain a positive suction pressure at the suction flange.
- Electrical feeds to fire pump controllers must have a two-hour fire rating.
- Fire pumps can't be used as pressure-maintenance pumps.

Fire Pump Sizing and Selection - PHCP Pros

Pumps should not be operated at or near rated pressures at idle speeds for extended periods. Localized overheating and damage can result. Never assume pumps in a double, triple or thru-drive pump assembly can be simultaneously loaded to rated pressure. Shaft loading must be checked for excessive torque and side loads. Pump Supercharge Pressure
