(PDF) Credit Risk Research: Review and Agenda

The credit valuation adjustment (CVA) of an OTC derivatives portfolio with a given counterparty is the market value of the credit risk due to any failure to perform on agreements with that counterparty. This adjustment can be either positive or negative, depending on which of the two counterparties bears the larger burden to the other of exposure and of counterparty default likelihood.

Measuring and marking counterparty risk

Synopsis. In this book, two of America's leading economists provide the first integrated treatment of the conceptual, practical, and empirical foundations for credit risk pricing and risk measurement. Masterfully applying theory to practice, Darrell Duffie and Kenneth Singleton model credit risk for the purpose of measuring portfolio risk and pricing defaultable bonds, credit derivatives, and other securities exposed to credit risk.

Credit Risk: Pricing, Measurement, and Management ...

The main focus is modeling credit risk: measuring portfolio credit risk and pricing different securities exposed to credit risk. The focus on credit risk management is less important in the book. The introduction (indeed the entire book) is very well written and presents the subjects treated with clarity.

Credit Risk: Pricing, Measurement, and Management. - Free ...

Formula of Credit Risk One of the simplest methods for calculating credit risk loss is the formula for expected loss which is computed as the product of the probability of default (PD), exposure at default (EAD), and one minus loss given default (LGD). Mathematically, it is represented as, Expected loss = PD * EAD * (1 - LGD)
