lateral deflection of a pile group is typically 2 to 3 times larger than the deflection of a single pile. Piles in trailing rows of pile groups have significantly less lateral load resistance than piles in the lead row. Laterally loaded pile groups have a group efficiency less than 1.

It is proven that laterally loaded piles embedded in sand can be analyzed within the working load range assuming a linear relationship between lateral load and lateral displacement. The proposed method estimates the distribution of lateral loads among piles in a pile group and predicts the safe design lateral load

As per Indian Standards, laterally loaded piles are usually analysed using the method adopted by IS 2911-2010 (Part 1/Section 2). But the practising engineers are of the opinion that the IS method is very conservative in design. This work aims at determining the extent to which the conventional IS design approach is conservative.
